

Tencent Cloud ADP — Hackathon Guide

AI CAN DO IT Hackathon Singapore 2026 · Build your agent on ADP, then put it to work.

Every screenshot in this edition is taken from the product's English interface.

1 About This Guide

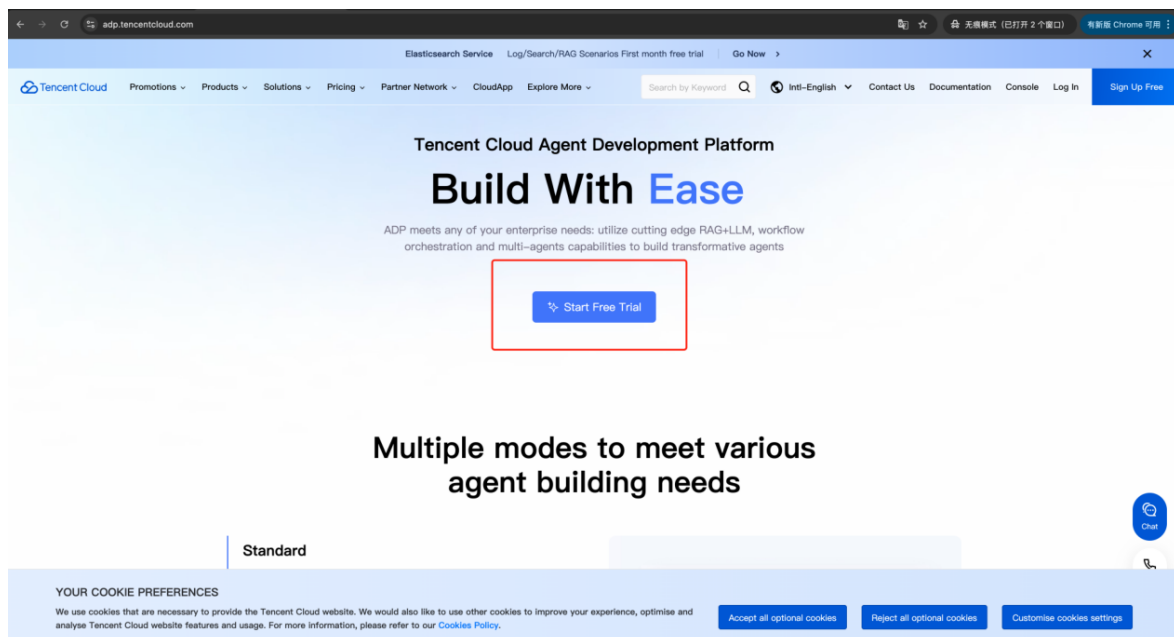

This guide is for teams taking part in the AI CAN DO IT Hackathon. It walks through opening a Tencent Cloud International ADP account step by step, building an agent in the console, and then handing that agent to other people or connecting it to your own system.

ADP supports both individual and enterprise registration. On first sign-in, either type of account receives a free allowance of knowledge base capacity and DeepSeek model tokens, which is enough to build your first hackathon agent straight away.

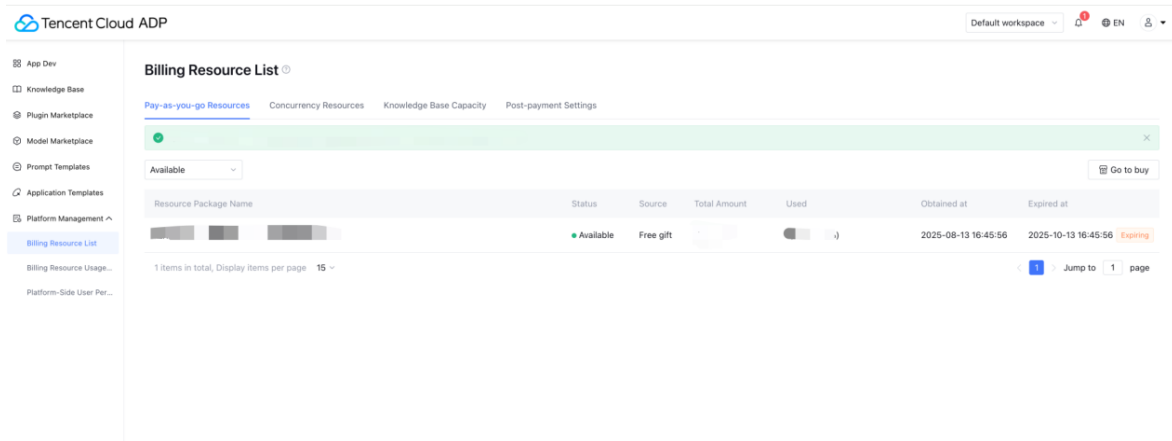

You can check how much free resource you have been granted, and how long it lasts, under the [Platform Management](#) area of the console.

2 Getting Started and Testing the Path

1. Visit the Tencent Cloud ADP landing page for the international edition, and read the product introduction. The videos on the site are the quickest way to understand what ADP does.

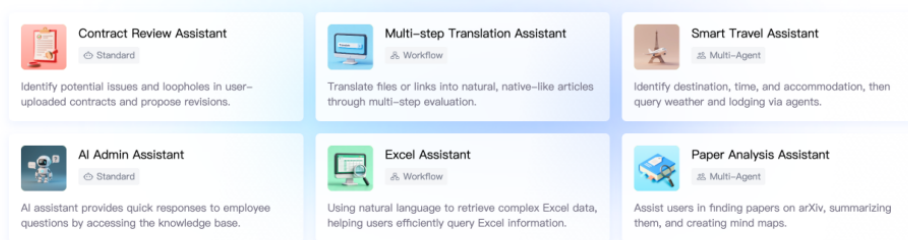

2. Review the product features and the introduction material provided on the official site.

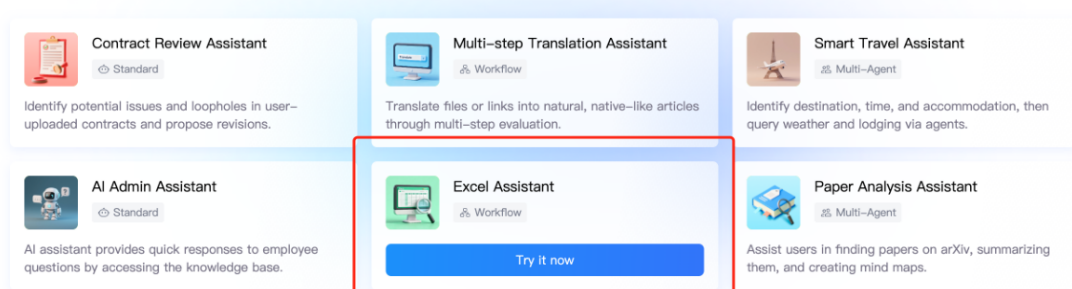

3. Open the **Build AI agents with ease** module and choose the business scenario you need.

Build AI agents with ease

4. Pick an agent and click **Try it now**.

5. Try the agent and see how it handles a conversation. The experience page also gives you a **Share link** and a **Share QR code** for the application.

Excel Assistant

Excel Assistant

Use natural language to query and analyze the company's complex Excel spreadsheets containing Equipment and Reimbursement data.

What Samsung phones that have been in use for over 2 years and are currently under repair?

Which department had the highest total reimbursement amount in 2024?

How many reimbursement transactions in 2024 have an amount greater than 100?

Please enter your question.

Q180000

Application description

Using natural language to retrieve complex Excel data, helping users efficiently query Excel information.

Key points of application development

Leverage Retrieval-Augmented Generation (RAG) to support natural language queries over complex Excel spreadsheets

Application configuration

Mode

Single-workflow mode

Model

DeepSeek-V3

Excel Assistant

- Purchase Date: 2021-09-18
- Usage Years: 3
- Location: New York - HQ
- Status: Under Repair
- Serial Number: F0T-0PVM9-241

2. Galaxy S22

- AssetID: IT0027
- Purchase Date: 2018-05-25
- Usage Years: 7
- Location: Remote
- Status: Under Repair
- Serial Number: O4K-H2VLP-791

Summary Table:

AssetID	Model	Purchase Date	UsageYears	Location	Status	Serial Number
IT0006	Galaxy S22	2021-09-18	3	New York - HQ	Under Repair	F0T-0PVM9-241
IT0027	Galaxy S22	2018-05-25	7	Remote	Under Repair	O4K-H2VLP-791

No other Samsung phones in the dataset meet both criteria (over 2 years of use and currently under repair). The other Samsung phones listed are either not under repair or have been in use for less than 2 years.

3. With an individual account you can skip the company information and card binding steps, and go straight into the product.

4. Open [App Dev](#) and you can create your own agent.

If you are an enterprise user, you must register as an enterprise account and complete the information. Note that enterprise users cannot skip these key steps. If you have any questions, contact your Tencent Cloud account manager.

4 What ADP Gives You: the Experience URL and the AppKey

Once the application is published, ADP gives you two things: a link that opens a chat with your agent, and a credential that lets your own software call that agent.

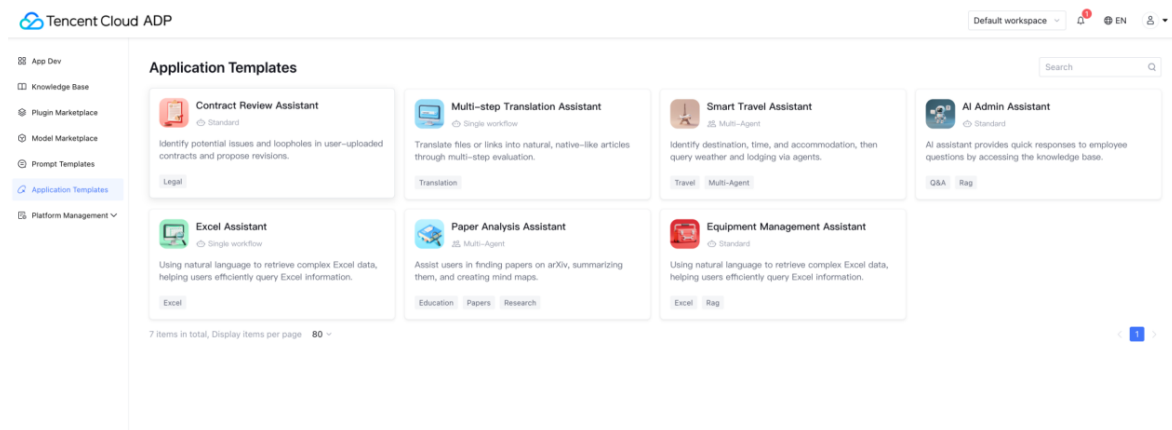

Item	What it is	What it is for	Secret
Experience URL	A link that opens a chat with your published agent	For people : checking your own work, teammates, judges, the demo video	Shareable
AppKey	The credential that lets your own system call the agent	For software : your application, a script or a platform calling the agent on ADP	Keep secret

In one line: **send the URL to a person, use the AppKey from your code.**

With the AppKey, your agent on ADP is no longer just a chat box in a console. It becomes a capability that your project's features can call.

5 Publishing and Exporting the Credentials

Only a published application in the running state can be called, and publishing is what creates the AppKey.

1. Open your application in the ADP console and confirm in the debug panel that the answers are what you expect.
2. Publish the application.
3. Open the **Publish** tab, then the **Service status** tab. The Experience URL is at the top; copy it and open it to chat with your agent.
4. Scroll down to the **API management** section. The Appkey sits in the table at the foot of that section and is shown only as a masked prefix; click **Copy** in the Actions column to get the full value. Store it somewhere safe, because the full value is not shown again.

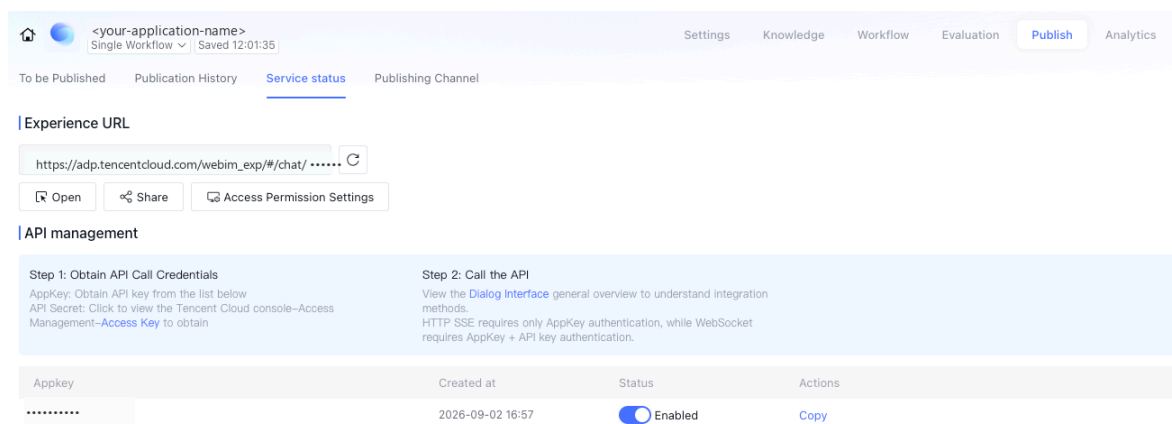

Figure 5-1 Where the Experience URL and the AppKey live in the ADP console

Note: The same section notes that HTTP SSE calls need the Appkey alone, while the WebSocket API needs the Appkey together with the API Secret.

Warning: The AppKey is the only credential for calling your application. Do not commit it to a public repository and do not put it into external material. Before you share a screenshot, check that the AppKey is not visible in it.

6 Using the URL and the AppKey

6.1 The Experience URL — for people

Send the link to a teammate or a judge and they can chat with your agent straight away, with no setup at all.

Good for: checking your own work, letting judges try it, recording the demo video, and putting a clickable entry point into your presentation.

6.2 The AppKey — for software

The AppKey is used through the ADP [Chat API](#). Anything that can make an HTTPS request can call it, for example:

- your own application backend
- scheduled scripts and automation
- a low-code platform, or another agent platform

The elements involved are listed below. For the full set of fields and events, refer to the ADP Chat API documentation.

Element	Description
Endpoint	https://wss.lke.tencentcloud.com/adp/v2/chat
Authentication	Send the AppKey with the request. HTTP SSE needs the Appkey alone
Question	Contents, for example a single text message
Session	ConversationId; reuse the same value for a multi-turn conversation
User	VisitorId; give each end user their own
Response	A stream of SSE events, returned as the answer is generated

Multi-turn conversations: pass the ConversationId returned by the previous call into the next one to keep the context. Give each end user a different VisitorId and ConversationId so that conversations do not run into each other.

7 How This Maps to the Hackathon

- The Hackathon Handbook lists ADP among the recommended Tencent Cloud services for building your agent.
- The suggested split is: [build and publish your domain agent on ADP](#), where model orchestration, the knowledge base, the workflow and the guardrails all come from the platform, and then:
- use the [Experience URL](#) to let judges and teammates try it, and to record the demo video;
- use the [AppKey](#) to connect the agent to your project's features, so that your application can call it for answers.
- The Handbook asks for proof that the project was built with the tools. Keeping the key screens and the call results will make that easier.

8 Common Questions

Symptom	What to do
The link does not open, or says the application is unavailable	Confirm the application is published and its status is running
An AppKey error is returned	Re-copy the AppKey and confirm that it belongs to that application
The full AppKey is not available	The table shows only a masked prefix; click Copy to get the full value
A multi-turn conversation loses context	Reuse the ConversationId returned by the previous call
The free quota runs out	Check the remaining quota and its expiry under Platform Management
Uploaded files are accepted but not used	Attach and publish a knowledge base for the application in ADP
